

The application of a rubberized sealant to the final few miles of selected City streets will take place through the month of June. The work began in April and uses a penetrating sealant known as Tire Rubber Modified Surface Seal made from recycled tires that helps extend the life of City streets by preserving pavement oils contained in the asphalt. The upcoming work will occur overnight from 7 p.m. until 4 a.m. at locations shown in red below and will require the closure of one travel lane in each direction.
